SAMPLE REPORT

Integrated GENETICS
LabCorp Specialty Testing Group

Inheritest® CF/SMA Panel

Patient Name: LASTNAME, FIRSTNAME
Referring Physician: REF. PHYSICIAN NAME
Specimen #: 00000000-00
Patient #: 00000000
Client #: 000000
Case #:00000000

DOB: MM/DD/YYYY
Sex: Male
Lab ID:
Hospital ID:
Specimen Type: Peripheral Blood

Date Collected: MM/DD/YYYY
Date Received: MM/DD/YYYY

CLIENT ADDRESS

Ethnicity: Not Provided
Indication: Screening

Disorder *(Gene)*	Results	Interpretation
Cystic fibrosis *(CFTR)*	POSITIVE for one c.254G>A (p.G85E) mutation	Predicted to be a carrier. Genetic counseling is recommended. See Additional Clinical Information.
Spinal muscular atrophy *(SMN1)*	AT RISK	2 copies of *SMN1*; positive for c.*3+80T>G SNP. At risk to be a silent carrier (2+0). For ethnic-specific risk revisions see Information Table. Genetic counseling is recommended.

Genetic counseling services are available. To access Integrated Genetics Genetic Counselors please visit www.integratedgenetics.com/genetic-counseling or call (855)GC-CALLS (855-422-2557).

ADDITIONAL CLINICAL INFORMATION

Cystic fibrosis: Cystic fibrosis (CF) is an autosomal recessive disorder with variable severity and age of onset. Symptoms of classic CF include elevated sweat chloride levels, progressive lung disease, pancreatic insufficiency, and male infertility. Individuals with mild CF may have pancreatic sufficiency. *CFTR*-related disorders include pancreatitis, bronchiectasis, and isolated male infertility due to congenital absence of the vas deferens. Treatment is primarily dietary and supportive. Genotype-targeted therapies may be available for some individuals. In severely affected individuals, lung transplantation may be indicated. (Moskowitz, PMID:20301428) Genetic counseling is recommended to discuss the potential clinical and/or reproductive implications of these results, as well as recommendations for testing family members and, when applicable, this individual's partner. If this individual's reproductive partner is also a carrier of a mutation in the same gene, the risk for an affected fetus is 25%.

Spinal muscular atrophy: Spinal muscular atrophy (SMA) is an autosomal recessive neurodegenerative disorder with variable age at onset and severity, characterized by progressive degeneration of the lower motor neurons in the spinal cord and brain stem, leading to muscle weakness, and in its most common form, respiratory failure by age two. Complications of SMA may include poor weight gain, sleep difficulties, pneumonia, scoliosis, and joint deformities. In severely affected individuals, abnormal fetal ultrasound findings may include congenital joint contractures, polyhydramnios, and decreased fetal movement (Korinthenberg, PMID:9307259). Treatment is supportive. Targeted therapies may be available for some individuals. Approximately 94% of affected individuals have 0 copies of the *SMN1* gene; in these individuals an increase in the number of copies of the *SMN2* gene correlates with reduced disease severity (Feldkotter, PMID:11791208). Individuals with one copy of the *SMN1* gene are predicted to be carriers of SMA; those with two or more copies have a reduced carrier risk. For individuals with two copies of the *SMN1* gene, the presence or absence of the variant c.*3+80T>G correlates with an increased or decreased risk, respectively, of being a silent carrier (2+0) (Luo, PMID 23788250; Feng, PMID 28125085). Genetic counseling is recommended to discuss the potential clinical and/or reproductive implications of these results, as well as recommendations for testing family members and, when applicable, this individual's partner.

Date Reported:

METHOD / LIMITATIONS:

Cystic fibrosis: *CFTR* gene regions are amplified enzymatically. 97 targeted CF mutations, listed below, are tested by multiplex allele-specific primer extension, bead array hybridization, and fluorescence detection. The test discriminates between p.F508del and three polymorphisms (p.I506V, p.I507V and p.F508C). Numbering and nomenclature follow Human Genome Variation Society recommendations. The DNA reference sequence is NG_016465.1. Legacy mutation names are available at www.integratedgenetics.com/CFplus.

Spinal muscular atrophy: The copy number of *SMN1* exon 7 is assessed relative to internal standard reference genes by quantitative polymerase chain reaction (qPCR). A mathematical algorithm calculates 0, 1, 2 and 3 copies with statistical confidence. When no copies of *SMN1* are detected, the primer and probe binding sites are sequenced to rule out variants that could interfere with copy number analysis and *SMN2* copy number is assessed by digital droplet PCR analysis relative to an internal standard reference gene. For carrier screening, when two copies of *SMN1* are detected, allelic discrimination qPCR targeting c.*3+80T>G in *SMN1* is performed.

Limitations: False positive or false negative results may occur for reasons that include genetic variants, blood transfusions, bone marrow transplantation, somatic or tissue-specific mosaicism, mislabeled samples, or erroneous representation of family relationships.

INFORMATION TABLES

CF risk reductions for individuals with no family history				
Disorder *(Gene)* Reference Sequence	**Population**	**Detection rate**	**Pre-test carrier risk**	**Post-test carrier risk with negative result**
Cystic fibrosis *(CFTR)* NM_000492	African American	81%	1 in 61	1 in 316
	Ashkenazi Jewish	97%	1 in 24	1 in 767
	Asian American	55%	1 in 94	1 in 208
	Caucasian	93%	1 in 25	1 in 343
	Hispanic	78%	1 in 58	1 in 260
	Mixed or other ethnic background	For counseling purposes, consider using the ethnic background with the most conservative risk estimates.
